

ABSTRACT

- A method for the production of an enzyme of interest, on an industrial scale, comprising
- a) fermentation of a microbial strain producing an enzyme of interest in a fermentation
 - 5 medium comprising one or more partially prehydrolysed complex N-source(s), wherein said partially prehydrolysed N-source(s) are sterilised separately from any other source containing carbohydrates, the prehydrolysis being achieved by addition of an acid and/or a hydrolytic enzyme; and
 - b) recovery of the enzyme of interest from the fermentation broth.
